

SANITATION IN THE WORKPLACES

HOW TO BEHAVE AFTER THE FIRST SANITATION TREATMENT?

The protection of health in the workplace starts with sanitation, but the maximum safety is achieved through simple and important measures

- ✓ **Sanitation** is the first essential step to destroy virus and bacterial load in the environment.
- ✓ But to avoid the **new risk of contamination and ensure the perfect safety of workers and customers**, it is necessary to ensure the **hygiene of people** through:
 1. **Daily cleaning with specific detergents with sanitizing action**¹ with particular attention to the 'contact points' (bathrooms, kitchen, lift, etc.).
 2. The use by all personnel of PPE (personal protective equipment) as **gloves and masks**
 3. Maintaining the **right safety distance**, especially if several people work in the same room

¹ Not all cleaning and sanitizing products are suitable and effective for proper disinfection and only a few have been recognized as actually able to eliminate encapsulated viruses such as Coronavirus Covid-19. Contact Easy Diplomacy to purchase the right products.

- ✓ Sanitation in the workplace should be an **ordinary and not extraordinary activity**. The recent Prime Ministerial Decree and the circulars of the Ministry of Health have in fact identified **periodic environmental sanitation** as the best form of contrast to the spread of COVID-19.
- ✓ The periodicity is **not fixed by law** but depends on the nature of the premises and the attendance of people. **Offices with few employees** sanitize every **10-15 days** on average.
- ✓ You should follow the advice and guidelines of experienced and trusted experts for a **tailored solution**.
